

EmoGraph: UI Redesign

Add description

EmoGraph

UI redesign concepts for day and night mode

Design overview

5 concepts.
Two
modes.
One
dashboard.

Concept 01

Mood Aura

Day mode — A glowing orb that shifts color and size with your mood intensity. Soft pastel gradients on warm white.

Mood Aura

Night mode

The same orb transforms - neon glow, particle effects, and electric color on a deep space canvas.

Concept 02

Mood Terrain Map

Your mood history becomes a living landscape. Peaks are joyful days. Valleys are hard ones. Plateaus are steady ground.

- **Day mode:** watercolor terrain, paper texture, warm greens and sky blues
- **Night mode:** bioluminescent contours, glowing lines on dark canvas, deep-sea mapping aesthetic

Mood Constellation
Each mood you log
becomes a star. Over
time, they connect into
a personal constellation
— your emotional
signature.

Today

21:00 **Happy** — Excited about project
18:30 **Sad** — Overwhelmed by workload
14:00 **Angry** — Frustrated with delay

Yesterday

19:00 **Love** — Time with partner
15:00 **Happy** — Celebrating achievement

Today

Glassmorphism card system

Frosted glass cards that shift with your mood

Day mode cards

Frosted white glass over pastel gradients. Warm peach-to-lavender-to-sky, with soft blur and shadow.

Night mode cards

Dark frosted glass over deep animated gradients. Midnight blue to teal, with subtle neon border glow.

Mood-reactive

Gradient shifts with your logged mood. Happy = amber. Sad = blue. Anxious = violet. Calm = green.

Mood Garden

Every logged day grows a plant. Consistent good moods bloom full gardens. Rough patches show wilting plants — but they recover.

Day mode

- Warm sunlit greenhouse
- Earthy cream backgrounds
- Green accents, wooden UI textures

Night mode

- Moonlit garden aesthetic
- Bioluminescent flowers
- Cyan and violet plant glows

Color system — day mode

■ Background

#FAF7F2

■ Surface

#FFFFFF

■ Primary

#7C5CFC

■ Secondary

#FF9A76

■ Accent

Night palette designed for OLED screens — true black saves battery

Layout guide

Dashboard layout

A structured 3-zone grid. Mood input at top, main visualization center, supporting cards below.

Hero aura orb + welcome message + mood selector. Always visible at top.

Weekly terrain chart or constellation map. Fills 60% of screen.

Streak counter + mood breakdown donut + quick journal entry.

Micro-interactions

Mood selection

Haptic ripple expands from selected mood. Emoji morphs smoothly between states.

Logging animation

Confetti burst on happy log. Gentle rain particles on sad log. Triggers on submit.

Theme toggle

Sun sets into moon over 0.6s. Sky gradient shifts from peach to navy. Smooth, not jarring.

Typography system

Three fonts. One personality.

Headings

Plus Jakarta Sans. Modern and rounded for all titles H1-H3. Weight: 700-800.

Body text

Inter or DM Sans. Maximum readability at small sizes, for descriptions and data. Weight: 400-500.

Mood labels

Caveat or Kalam. Handwritten feel for mood names and journal labels. Weight: 400.

Use this with ChatGPT

Copy this prompt and paste into ChatGPT to generate React + Tailwind code for any of these concepts.

Add your current site screenshots as context so ChatGPT can match your existing structure.

1. Pick a concept

Choose Aura, Terrain, Constellation, Glassmorphism, or Garden - or mix and match elements from multiple concepts.

2. Choose your stack

Specify React, Vue, or plain HTML/CSS - paired with Tailwind or CSS modules. State your preference upfront to get clean, ready-to-use output.

3. Paste this prompt

"Build the EmoGraph dashboard in [CONCEPT] style using [STACK]. Day/night toggle. Include: mood input, weekly chart, streak counter, breakdown, journal card. Add micro-interactions on mood select and theme toggle."
